

ADDRESS

BY

**H.E. YOWERI KAGUTA MUSEVENI
PRESIDENT OF THE REPUBLIC OF UGANDA**

TO THE NATION

**ON THE CORONA VIRUS (COVID 19)
GUIDELINES ON THE PREVENTIVE MEASURES**

**18TH MARCH, 2020
STATE HOUSE – ENTEBBE**

Countrymen and Countrywomen,

Greetings to you all.

Today, I have come to address you on the issue of the Corona virus, abbreviated as Covid19. They call it corona because, under the micro-scope, it looks like a crown (*ekiruunga, engure*). This is a new virus but it belongs to the family of the common-cold (*Senyinga, Rubyamira*) group of viruses. It makes some people very sick because, being a new virus, all of us do not have immunity against it because we had never been exposed to it.

Fortunately, after listening carefully to our scientists and after watching commentators in the countries where it is already active, it seems to have two characteristics that will help us to survive it and defeat it. Characteristic number one, is that it does not kill many of the people it infects. Out of the approximately 150,000 people that have been infected world-wide, only about 5,000 have died, which works out at 3%. With Ebola in Uganda, the percentage of the people dying was 67%. Secondly, this virus enters the body only through the soft parts of the body: the nose, the eyes and the mouth. It cannot go through an intact skin like some of the diseases used to: yaws, leprosy, etc.

This, therefore, means that even when you get near a person with the virus in his/her body, he/she can only infect you if he/she sneezes (*Okwetsyamura*) or coughs (*Okukororra*) near you so that the tiny and invisible *bimira* (mucous from the nose) or spittle (*machwaante*) enter your nostrils or those infected materials from the body land on a surface (a table, a chair, a door handle, a hand kerchief, etc.) where the virus can stay alive for 3 hours and you, then, touch it and, then, touch your soft parts of the body (the eyes, the mouth and the nose). It is this characteristic that makes it very infective.

The Cabinet, under my Chairmanship, on Monday, the 16th of March, 2020, sat and decided as follows:

Although the kill ratio of the virus is not very high compared to, for instance, Ebola, this is if the victims are in perfect health. With the healthy young people, for instance, some information says that an infected person may not even know that he/she has any problem.

She/he may defeat the virus without even knowing that it ever attacked him or her. The real danger to society, however, is for old people, 70 years and above and people with other diseases they have been surviving with. Such diseases are like: TB, HIV,

diabetes, hypertension, etc. It is these that will be very sick or even die. Since we have a very large number of people living with HIV (1.4 million), having diabetes (800,00), hypertension (4.8m), TB (100,000 per year), we must do everything possible to ensure that this enemy does not come here, does not find plenty of dry grass piled up and ready for flaming. What is the dry grass that can help to start and sustain fire of a corona-virus epidemic? It is the big masses of people, gathered together and in close proximity.

What are these masses of people that are gathered in groups that can easily aid the spread of the virus? They are the following:

1. The students. The NRM has promoted education. As a consequence, today, there are 10.7million children in the Primary Schools; 2m children in the Pre-Primary Schools; 2 million students in the Secondary Schools; 314,548 students in the Universities and Tertiary Institutions. This is a total of almost 15 million young Ugandans, distributed in 36,285 Primary Schools (Government and Private), 7,308 Pre-Primary Schools (Government and Private); 5,553 Secondary Schools (Government and Private) and 49 Universities and 1,543 Tertiary Institutions (Technical Schools, Teacher Training Colleges,

Vocational Schools), etc., etc. This is a total of 50,688 points with concentrations of 1,000 or more persons each. When I visited Masaka SS in Masaka Town, it had 4,000 pupils without counting the other non-student people staying in that compound. It is wise that we temporarily remove these concentration points by closing all the Primary and Secondary schools as well as all the Universities and Tertiary Institutions for one month, starting with Friday, the 20th of March, 2020, starting at mid-day. All these institutions, without exception, should close so that we deny this virus those concentrations. The 42 million Ugandans are divided into about 8million homesteads. Once the Educational Institutions population goes home, they will disperse into these 8million homesteads that have much less concentrations. If the 15million were to disperse equally into the 8million homesteads, each homestead would take one and a half students. Since we cannot have a half a student, let us correct to the nearest whole number and we end up with 2 students per each homestead. It is a smart way of avoiding these concentrations in the face of this danger. I have decided to close the Educational Institutions even before the occurrence of a single corona incident because I have observed the situation in other countries.

Once the epidemic breaks out, there is so much stampede that the first suspect to be affected is transport. You have seen how Airports were clogged with people. That crowding is perfect ground for new infections. Let us, therefore, move early to avoid the stampede.

2. Once we deal with the concentrations in the Educational Institutions, the next concentrations that we must deal with are the religious gatherings: prayers in Churches, in Mosques, open air prayers and services on Fridays, Saturdays and Sundays. In the interests of our people's health, these should be suspended for a month with immediate effect. Why with immediate effect? The answer is, a question of logic: "What if a person that is not yet infected today with the virus is infected tomorrow, Thursday the 19th of March, 2020, was to be infected in the last Service that had been called "to pray for the last time?" How would God forgive us and how would we forgive ourselves?" When it comes to health, it is better to be a coward and be on the side of caution. If there is no danger after one month, that will be good. If there was danger, we would have avoided it. The Prayers will continue but in homes. The Religious leaders can use the TVs, Radios stations to continue

preaching. His Holiness, Pope Francis, as usual set a good example of enlightenment on this by abandoning his customary preaching in St. Peters' Square and is instead, using the TV.

3. Then the next category of mass meetings are the political or cultural – Public rallies, conferences, elections, etc. All these are hereby forbidden for 32 days with immediate effect.
4. Up to today, the 18th of March, 2020, Uganda, by the mercy of God, has been spared by not having even one case confirmed of the corona-virus. There has been many false alarms that our laboratories have proved false. However, there are countries in the world that have had many cases. We describe these countries as category one countries in terms of the epidemic. These countries are: Italy, France, South Korea, China, USA, United Kingdom, Netherlands, Switzerland, Sweden, Belgium, Germany, Spain, Norway Austria, Malaysia, Pakistan and San Marino. We, with immediate effect, ban all out-bound movement by Ugandans to or through these countries, again, for 32 days. Foreigners going to those countries are free to do so provided they do not intend to come back within the prohibited time. We extend our sympathies to those

countries and commend them for fighting on the behalf of the human race.

5. We cannot stop Ugandans coming back from abroad, even from the category one countries that I read above. However, such Ugandans will be put in a mandatory quarantine in a designated place but they will pay the cost for their institutional quarantine – food, etc. If they want to avoid that inconvenience or cost, they can sit out the storm in the country of their temporary abode.
6. The next points of mass concentrations are the non-agricultural work places: factories, hotels, large plantations, markets, taxi-parks, etc. These should continue functioning but with SOPs (Standard Operating Procedures) put out by the Ministry of Health. These will include: compulsory hand-washing by all persons who enter or exit those work places, anybody with symptoms of sickness should not be allowed access for any reason, by the employers installing temperature monitors. The Ministry will publish the detailed SOPs as part of the Statutory Instrument to be signed by the Minister of Health with immediate effect.

7. Then, the issue of Uganda-style weddings that bring together a pentagon of groups: the clan members of the bridegroom (*Kishweera*); the clan members of the bride (*Kishwerwa, Omugore*); the maternal clans of the two couples (*Obukojja – Obwihwa*); the school alumni of that couple; and the neighbours and friends. These tend to be big gatherings of people coming from the 6 points of the compass. This multi-directional source of the *Mbagga* attenders, can be as source of great danger. It is, therefore, decided that the wedding of this type should be postponed for 32 days from today. If, however, the couples intending to marry are really in a hurry, they could go for a purely scientific wedding, only involving the core stakeholders who are: the bride-groom, the bride, the best-man, the assistant to the bride (matron), the Priest (or the CAO), etc., as long as the number is less than 10 people. The scientific marriage could, then, later, at an appropriate time, be followed by the Uganda-style one. Maama Janet and myself, used the scientific one in 1973 and we have not regretted. The “Coronavirus” that time was the Amin regime. Much, much later, with adult children and grandchildren, Janet and myself, were able to celebrate the 40th anniversary of our marriage the Uganda-style with the whole Rwakitura compound full of

people, with our grand-children as the bridesmaids. The impatient intending couples could look at this model.

8. The other occasion that gathers a lot of people is a funeral. Again, relatives, friends, associates, neighbours, etc., turn up in big numbers. Again, with this virus, this is a danger point. Many people could be infected there. We cannot ban or postpone burials for 32 days. It would not be rational. We, therefore, recommend that the burial is done by the relatives who are nearby. They should be the ones to *Kuziika* (to bury). Then the mourning (the *kukungubaga – ekyosi*) could be later when the rituals could be done. This may combine both science and culture. Most importantly, it would be safe for the participants. If the deceased is, however, suspected of dying from the corona-virus, the State will take over and bury the person in the scientific way without the involvement of the family as we did for the Ebola victims. We should not replicate the lack of enlightenment that was exhibited in West Africa where the ritual of washing dead bodies was maintained even when people were dying from Ebola. The consequence was that the “bathers of the dead bodies” ended up dying themselves in service of a non-scientific

cultural practice. By confronting this disease with enlightened, scientifically based actions, we shall defeat it as we did with Ebola three times, with Marburg and with AIDS.

9. The other big category of Ugandans are the farmers – the crop people, the cattle keepers and the fishermen. These account for 10million families according to the 2014 Census, with a population of 33 million people. These, however, may not be a problem by themselves because they live in scattered homesteads and do not allow much concentration of persons. If they are not pulled by the Churches and Mosques or by politicians for political rallies, they will go about their most useful activities in their dispersed form that is not a danger to themselves or to others. However, they should all observe the hygienic practices recommended in this and subsequent communications. The Technical Committee on Health should, however, study more the issue of the fishermen. Although they fish separately, they live in concentrated landing sites. The Technical Committee will evolve the appropriate SOPs. With the other category of farmers (cattle keepers and cultivators), the other danger area are the monthly markets. These should also be suspended for the 32 days. Buying of crops and

livestock (cattle, goats, chicken, etc.), can go on but from the homesteads. They do not have to congregate.

10. The next frontline with this virus is public transport – the boda-bodas, the taxis, the buses, the mini-buses and the trains. Everybody can see, the clear danger here, is of many people sitting next to one another in the confined space of the vehicle from Lira to Kampala etc. Therefore, the advice here is: “Do not travel unless it is absolutely necessary, if you are using public transport”. Additionally, the companies that operate these means of transport should be given mandatory SOPs by the Ministry of Health: hand-washing, not allowing sick people on board, temperature monitors etc. With these precautions, public transport will continue. However, in the event of an outbreak in a given locality, public transport in that area will be forbidden and the area will be isolated.
11. The next frontline of fighting the virus is to stop the merry-making – the discos, the dances, bars, sports, music shows, cinemas and concerts. These are very dangerous gathering points with the virus around. Drunkards sit close to one another. They speak with saliva coming out of

their mouth. They are a danger to themselves. All these are suspended for a month.

12. With these measures taken to deny the virus mass concentrations of Ugandans, the next area to look at is Hygiene. The virus, according to the facts known so far, spreads by *okwetsyamura* (sneezing) and *kukorora* (coughing) whereby, through your micro-mucous (*ebimira*) or your spittle (*otuchwante*), you pollute the air around you and the virus can now enter the nose of the nearby people through breathing. That is why it is important that anybody with a cough or cold should not go into public. You should self-isolate yourself or be isolated by force, if you are not responsible enough to govern yourself for the general good. Even at home, always cough or sneeze into a handkerchief which you should frequently wash, dry and iron with a hot flat-iron or use a disposable tissue which you should then, either flush in the toilet or incinerate in a *Sigiri*. Do not spray the public or your family with your mucous or spittle through primitively sneezing or coughing without precautions or blocking your output in the manner suggested. Once the individuals control coughing and sneezing, then the next danger point is touching surfaces with infected hands: tables, door-handles, telephone

hand-sets etc. Here, the answer is to cough and sneeze into the tissue which you destroy so that your hands are not contaminated. In any case, you regularly wash these hands. Therefore, your hands do not pollute the surfaces. With money in markets and Banks, the Ministry of Health will publish SOPs governing that aspect, including disinfecting the coins, using mobile money, using online purchases etc. Once you avoid open coughing and sneezing and you wash your hands regularly, then you will not contaminate the surfaces – the tables, the door handles etc. That will protect the public. The virus, even if you have it, will remain with you until you get healed. It is good that for some time now, we have stopped the practice of shaking hands and hugging. There is also the side of everybody protecting oneself. As you heard, the virus only enters the body through the soft parts of the body: the mouth, the nose and the eyes. Even if the surfaces are contaminated with the virus and you touch those surfaces, yes the virus will be on your hand. However, it will not enter your body unless you touch yourself in the soft parts of your body before washing. These soft parts are: the eyes, the mouth and the nose. If you wash with soap, before you touch those soft parts, the virus will die.

13. Then, there is the issue of nutrition so as to eat foods that strengthen our body soldiers (the immune system) to fight the enemy. Apart from ensuring a balanced diet which the District Medical Officers, through fortnightly addresses to all of you, should inform you about, in the particular fight against this virus, there is the need to take in good quantities of Vitamin C, through eating oranges and lemon and also eating ripe bananas to get folic acid and Vitamins B6. The folic acid and the Vitamins B6 help the nervous system of the body. Ascorbic acid from the oranges helps your body to produce blood cells and build immunity. Therefore, apart from de-congesting population concentrations so as to deny the virus big bodies of our citizens to easily infect and spread, the other important measure is the one who is having a cold not to spray the innocent with *okwetsyamura* (sneezing) or coughing into the open air. Block your sneezing with the tissue, if you are the rich type that can afford tissues or into handkerchiefs that you frequently wash, dry and iron. Wash your hands with soap so that you remove the virus on your hands so that you do not contaminate the surfaces. Then, on the defensive side, make it a habit never to casually touch your mouth, your

nose or your eyes with unwashed hands, in case you touched contaminated surfaces. Eversince 1959, at Mbarara High School, when I attended my confirmation course (*Kitebwaho emikono*), the Reverend Yustus Ruhiindi advised us to use our left hand to receive the bread for the Holy Communion because the right hand would have been contaminated with the greeting of people. It is now 61 years since. In all that time, my right hand is for greeting, opening doors, handling pens etc. The left hand is reserved for myself – blowing my nose, etc. This was long before these diseases –Ebola, Corona-virus, etc. It was a wise advice. The Ugandans could look at it. I never allow my right hand to touch my left hand before washing. That is why I never clap hands. I normally bang the tables with the same right hand that I donated to the public long ago. I never want my right hand to contaminate my left hand which is strictly for myself.

Otherwise, Uganda is prepared. We have isolation centres. We have long had the testing capacity within the country eversince the first Ebola days. We have some factories providing hand sanitizers and we are going to have more. Some factories will start producing face masks of the different types. There is

even some talk of treatment using the old chloroquine.

However, prevention is better than cure. On the side of the economy, there is no doubt that some sectors like tourism, hotels, sports, entertainment, etc., will be hit by the phenomenon of this disease. However, others like the manufacturing sector will get a boost. The countries of the World, by their selfish actions, are, again, waking up Africa that that it is – suicidal to depend on others. I have warned our people to stop talking like the selfish foreigners by trying to stop the little we have, being exported to other African countries. We can keep a bit for ourselves but we shall share with the others whatever we have. The blocking of imports should, therefore, get the long-sleeping Ugandans to wake up and use the huge amount of money they long earned by turning our market into a dumping point for foreign goods to build our own manufacturing capacity. Through the BUBU, we shall help those groups. Everything you have been importing, except for petroleum products for now, now make here. The US\$7bn you have been using to import, keep it here. Turn misfortune into an opportunity.

On Saturday 21st March, the 41st Anniversary of the defeat of Idi Amin's forces at Rugando by the TPDF

Force of 80 KJ and Task Force BN and Fronasa Forces, I have invited the top leaders of the Faiths for National Prayers at Entebbe State House. The few of us will pray for the whole country together. All of you pray in your homes, God will hear us.

In order to synchronize the dates with the closure of the schools on Friday, the actions of suspending the other activities that are starting immediately will run for 32 days not 30 days.
